ERA 7900 Series ERA 8900 Series

Scale-Tape Angle Encoders with Very Large Operating Tolerances

Reliability

Exposed angle encoders without integral bearing from HEIDENHAIN are optimized for use on fast, precise machines. In spite of the exposed mechanical design, they are highly tolerant to contamination, ensure high long-term stability, and are quickly and easily mounted.

Lower sensitivity to contamination

Both the high quality of the grating and the scanning method are responsible for the accuracy and reliability of the encoders. Encoders from HEIDENHAIN operate with single-field scanning. Only one scanning field is used to generate the scanning signals. Local contamination on the measuring standard (e.g. fingerprints or oil accumulation) influences the light intensity of the signal components, and therefore of the scanning signals, in equal measure. The output signals do change in their amplitude, but not in their offset and phase position. They remain highly interpolable, and the position error within one signal period remains small.

The large scanning field additionally

reduces sensitivity to contamination. In many cases this can prevent encoder failure. Even if the contamination from printer's ink, PCB dust, water or oil is up to 3 mm in diameter, the encoders continue to provide high-quality signals. The position errors within one revolution remain far below the specified accuracy.

Photoelectric scanning in accordance with the imaging principle with a steel scale and single-field scanning

Durable measuring standards

By the nature of their exposed design, the measuring standards of angle encoders without integral bearing are less protected from their environment. HEIDENHAIN therefore always uses tough gratings manufactured in special processes.

In the DIADUR process, hard chrome structures are applied to a glass or steel carrier.

In the METALLUR process a reflective gold layer is covered with a thin layer of glass. On this layer are lines of chromium only several nanometers thick, which are semitransparent and act as absorbers. Measuring standards with METALLUR graduations have proven to be particularly robust and insensitive to contamination because the low height of the structure leaves practically no surface for dust, dirt or water particles to accumulate.

Due to the high surface hardness, even frequent cleaning will not harm the graduation.

Composition of a METALLUR graduation

Mechanical design types and mounting ERA 7900 and ERA 8900 series

Application-oriented operating tolerances

The operating tolerances of the ERA 7900 and ERA 8900 series have only a slight influence on the output signals. In particular, a variation in the scanning gap between the graduation carrier and scanning head causes only negligible change in the signal amplitude, and barely affect the position error within one signal period. This feature permits extraordinarily large mechanical operating tolerances.

Influence of the scanning gap on the signal amplitude for ERA 7900 and ERA 8900

The ERA 7900 and ERA 8900 series of angle encoders consist of a scanning unit and a one-piece steel scale tape. The steel scale tape is available up to a length of approx.180 m.

- The tape is mounted on
- the inner ring (ERA 7900 series)
- the outer ring (ERA 8900 series)

The ERA 7900C and ERA 8900C angle encoders are designed for full-circle applications. Thus, they are particularly suited to hollow shafts with large inside diameters and to applications requiring accurate measurement over a large circumference, such as large rotary tables or telescopes.

In applications where there is no full circle, or measurement is not required over 360°, circle segments are available for the ERA 8900 series.

Mounting the scale tape for full-circle applications

segments

ERA 74x0 C: An internal slot with a specified diameter is required for receiving the scale tape. The scale tape is inserted starting at the butt joint and is clicked into the slot. The length is cut so that the tape is held in place by its own force. To make sure that the scale does not move within the slot, and that the tape tension is equal over the entire circumference, the tape is additionally bonded to the slot floor.

ERA 89x0C: The scale tape is supplied with the halves of the tensioning cleat already mounted on the tape ends. An external slot is necessary for mounting. A recess must also be provided for the tensioning cleat. After the scale tape has been inserted, it is fastened aligned along the slot edge and tensioned using the tensioning cleat.

Operating tolerance (in combination)			
Axis	Incremental and Reference mark track	Incremental track	
Y	±0.5 mm	±1 mm	
Z	±1.2 mm	+1.2 mm/-2.0 mm	
Roll (X)	±2.0 mrad	±5.0 mrad	
Pitch(Y)	±0.5 mrad	±5.0 mrad	
Yavv (Z)	±0.2 mrad	±5.0 mrad	

Operating tolerances for ERA 7900 and ERA 8900 after ideal mounting at diameters above approx. 3 m

Protection against ambient light influences

Due to the large scanning gap, intensive ambient light can have a negative effect on the signal quality of the measuring device. In these cases, a suitable cover has to be provided in order to avoid direct illumination of the scanning head.

Cover to prevent the penetration of ambient light into the scanning gap

The provided mounting aid facilitates the correct alignment of the scanning head relative to the tape during assembly.

Mounting the scale tape for circle

ERA 89x1 C: The scale tape is supplied with premounted end pieces. An external slot with recesses for the bearing pieces is required for placing the scale tape. The end pieces are fitted with tension springs, which create an optimal bearing preload for increasing the accuracy of the scale tape, and evenly distribute the expansion over the entire length of the scale tape.

ERA 89x2C: An external slot or one-sided axial stop is recommended for placing the scale tape. The scale tape is supplied without tensioning elements. It must be preloaded with a spring balance, and secured using the two oblong holes.

The scale tape ends are manufactured so exactly that only minor signal-form deviations can occur in the area of the butt joint. Depending on individual conditions (temperature, diameter, thermal expansion coefficient), various measures are required to make sure that the scale does not move within the slot.

ERA 7900 series

Incremental angle encoders for high accuracy and very large operating tolerances

Steel scale tape for internal mounting

- Full-circle versions, also for very large diameters
- Consisting of a scanning head and scale tape

Scanning head	AK ERA 7980
Scanning gap	Nominal 3 mm Variation ±1.2 mm
Interface	\sim 1 V _{PP}
Cutoff frequency –3 dB	≥ 350 kHz
Electrical connection	Cable 3 m, with M23 coupling (12-p
Cable length	\leq 150 m (with HEIDENHAIN cable)
Voltage supply	5 V DC ±0.25 V
Current requirement	< 100 mA (without load)
Vibration 55 to 2000 Hz Shock 6 ms	\leq 200 m/s ² (EN 60068-2-6) \leq 1000 m/s ² (EN 60068-2-27)
Operating temperature	–10 °C to 50 °C
Protection EN 60529	IP40
Weight	\approx 20 g (without cable)

Scale Tape	MSB ERA 7900C full-circle version
Measuring standard Grating period Coefficient of expansion	Steel scale-tape with METALLUR g 40 μ m $\alpha_{therm} \approx 10.5 \cdot 10^{-6} \text{ K}^{-1}$
Signal periods	Upon request
Accuracy of the graduation	According to individual error budget
